

Assistance

Routine	Description
 importFiles	Import file(s) into H ₂ O
 importSqlTable	Import SQL table into H ₂ O
 getFrames	Get a list of frames in H ₂ O
 splitFrame	Split a frame into two or more frames
 mergeFrames	Merge two frames into one
 getModels	Get a list of models in H ₂ O
 getGrids	Get a list of grid search results in H ₂ O
 getPredictions	Get a list of predictions in H ₂ O
 getJobs	Get a list of jobs running in H ₂ O
 runAutoML	Automatically train and tune many models
 buildModel	Build a model
 importModel	Import a saved model
 predict	Make a prediction

PARAMETERS

model_id

drf-b5713458-ed7-46c5-b920-b5ecbea620c7

Destination id for this model. It is auto-generated if not specified.

training_frame

flatfile_prod2.hex

Id of the training data frame.

validation_frame

flatfile_prod2.hex

Id of the validation data frame.

nfolds

0

Number of folds for K-fold cross-validation (0 to disable, >= 2).

response_column

P5_eff

Response variable column name.

ignored_columns

Search...

Names of columns to ignore during training.

Showing page 1 of 17. -162 ignored.

← Previous 10

→ Next 10

Only show columns with more than 0 % missing values.

ignore_const_cols

☒

Ignore constant columns.

ntrees

10

Number of trees.

max_depth

20

Maximum tree depth (0 to unlimited).

min_rows

1

Fewest allowed (weight of) observations in a leaf.

<i>nbins</i>	20	For numerical columns build a histogram of (at this many bins, then split best point
<i>seed</i>	-1	Seed for pseudo random number generator (if applicable)
<i>mtries</i>	-1	Number of variables randomly sampled as candidates to split. If set to -1, default \sqrt{p} for classification for regression (where p is number of predictors
<i>sample_rate</i>	0.632	Row sample rate per tree (0.0 to 1.0)

ADVANCED

<i>score_each_iteration</i>	<input type="checkbox"/>	Whether to score during iteration of model training
<i>score_tree_interval</i>	0	Score the model after every many trees. Disabled if <code>score_each_iteration</code> is true
<i>fold_column</i>	(Choose...)	Column with cross-validation fold index assignment per observation.
<i>offset_column</i>	(Choose...)	Offset column. This will be added to the combination of other columns before applying the model function.
<i>weights_column</i>	(Choose...)	Column with observation weights. Giving some observation a weight of 2 is equivalent to excluding the dataset; giving an observation a relative weight of 0.5 is equivalent to repeating the row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is the number of times a row is repeated, but non-integer values are supported as long as they are positive. During training, rows with higher weights matter more due to the larger loss function pre-factor. If you set weights for a row, the returned prediction frame at that row is zero and this is incorrect; an accurate prediction, all rows with weight == 1
<i>nbins_top_level</i>	1024	For numerical columns build a histogram of (at this many bins at the top level, then decrease by factor of 2 for each level
<i>nbins_cats</i>	1024	For categorical columns (factors), build a histogram of this many bins, then split best point. Higher values lead to more overfitting

<i>r2_stopping</i>	1.7976931348623157e+308	<i>r2_stopping</i> is no longer supported and will be ignored - please use <i>stopping_rounds</i> , <i>stopping_metric</i> and <i>stopping_tolerance</i> instead. Previous version of H2O stopped making trees when <i>stopping_metric</i> equals or exceeds <i>stopping_tolerance</i> . Early stopping based on convergence of <i>stopping_metric</i> . Stop if the moving average of length <i>stopping_rounds</i> does not improve for <i>k:=stopping_rounds</i> consecutive scoring events (0 to disable).
<i>stopping_rounds</i>	0	Metric to use for early stopping (0 to disable). (AUTO: logloss for classification, deviance for regression, anomaly_score for Isolation Forest). Note that custom metrics can be used in GBM and DRF via the Python client.
<i>stopping_metric</i>	AUTO	Relative tolerance for non-based stopping criterion (relative improvement is at least this much)
<i>stopping_tolerance</i>	0.001	Maximum allowed runtime in seconds for model training. 0 to disable.
<i>max_runtime_secs</i>	0	Model checkpoint to retrain with.
<i>checkpoint</i>		Column sample rate per tree (from 0.0 to 1.0)
<i>col_sample_rate_per_tree</i>	1	Minimum relative improvement in squared error reduction per split to happen
<i>min_split_improvement</i>	0.00001	What type of histogram for finding optimal split
<i>histogram_type</i>	AUTO	Encoding scheme for categorical features
<i>categorical_encoding</i>	AUTO	Distribution function
<i>distribution</i>	AUTO	Reference to custom evaluation function, format: <code>`language:keyName=functionName`</code>
<i>custom_metric_func</i>		Automatically export generated models to this directory
<i>export_checkpoints_dir</i>		Gains/Lift table number. 0 means disabled.. Default is 1. -1 means automatic binning
<i>gainslift_bins</i>	-1	Set default multinomial type.
<i>auc_type</i>	AUTO	

EXPERT

<i>build_tree_one_node</i>	<input type="checkbox"/>	Run on one node only; reduces network overhead but fewer cpus used. Suitable for large datasets.
----------------------------	--------------------------	--

<i>sample_rate_per_class</i>		A list of row sample rate per class (relative fraction of the total sample, from 0.0 to 1.0), for each class
<i>binomial_double_trees</i>	<input type="checkbox"/>	For binary classification, using 2x as many trees (one per class) - can lead to higher accuracy
<i>col_sample_rate_change_per_level</i>	1	Relative change of the sampling rate for every level (must be > 0.0 and <= 2.0)
<i>calibrate_model</i>	<input type="checkbox"/>	Use Platt Scaling to calculate calibrated class probabilities. Calibration can provide more accurate estimates of class probabilities.
<i>calibration_frame</i>	(Choose...)	Calibration frame for Platt Scaling
<i>check_constant_response</i>	<input checked="" type="checkbox"/>	Check if response column is constant. If enabled, the exception is thrown if the response column is a constant value. If disabled, then the model will train regardless of the response column being constant or not.

nbins20

Select columns?☐

2D PDP Columns:

+ Add

Actions:

🔗 Compute

Row for which partial dependence will be calculated instead of the whole input frame (-1 for all).

How many levels should PDP compute. More levels will make it slower.

Checking this will allow you to select custom columns for PDP. By default, the top 10 features are used. Those features are sorted by variable importance.

Select lists of column name pairs to plot 2D partial dependence plot for.
